

Home solar power generation system example

Overview

The PV strings section implements a home installation of six PV array blocks in series that can produce 2400 W of power at a solar irradiance of 1000 W/m². In the Advanced tab of the PV blocks, the robust discrete model method is selected, and a fixed operating temperature is set to 25 degrees C. The power produced by the PV strings is fed to the house and utility grid using a two-stage converter: a boost DC-DC converter and a single-phase DC-AC full-bridge converter. Both. Run the simulation and observe the resulting signals on the various scopes. (1) At 0.25s, with a solar irradiance of 1000 W/m² on all PV modules, steady state is reached. The solar system. The grid is modeled using a typical pole-mounted transformer and an ideal AC source of 14.4 kVrms. The transformer 240 volt secondary winding is center-tapped and the central neutral wire.
