

# How to match the battery for high current

## Overview

If the cell manufacturer can deliver cells with a proven quality history of OCV within  $\pm 0.02V$  then you will be able to assemble and charge these cells without gross balancing. However, you will need to consider a. This is what you are probably trying to avoid as it can take hours or even days for the pack balancing to remove large SoC differences. An SoC difference of 10% on a 100Ah cell will take a long time. This is the approach used by the satellite industry and adopted by motorsport. The cells undergo a number of checks from visual inspection, capacity and internal resistance measurements. Similar to option 3, but using just OCV to group cells such that the initial SoC of the cells in a pack will not require gross balancing. This does mean that you need to measure the voltage. Prior to assembling the battery packs you can charge/discharge all of the cells to a defined voltage. This ensures all of the cells are matched in SoC prior to assembly.

Detailed explanation of high current battery

What is the purpose of using a high current battery. Using a high current battery is always a great idea when you need a fast energy supply in the case of charging a device or equipment. The high current supply will ensure high energy density and fast power supply which reduce the overall time frame needed to charge the device.

How do I match a battery pack voltage to my solar panels?

"A solar panel is a constant-current source, not a constant-voltage source." It's worse than that -- it's constant current up to a point, and then the current starts dropping with increasing voltage. In general you need a battery controller with maximum power point tracking (MPPT).

Car battery: how to find the right one and replace it?

- The battery as an accumulator is constantly subject to charging and discharging.
