

Photovoltaic solar panel grid-connected inverter

Overview

A grid-tied solar inverter converts DC power from your panels into AC that matches the grid's voltage, frequency, and waveform. It continuously monitors grid conditions, feeds excess energy back for net metering credits, and automatically shuts down during outages to protect. A grid connected PV system is one where the photovoltaic panels or array are connected to the utility grid through a power inverter unit allowing them to operate in parallel with the electric utility grid. While solar inverters are the most common type of inverter used for residential solar, they are just one of several inverter. Most PV systems are grid-tied systems that work in conjunction with the power supplied by the electric company. In order to harvest the energy out of the PV panel, a Maximum Power Point Tracking (MPPT) algorithm is required.
