

Solar panels connected in series with different currents

Overview

As we said above, when connecting solar panels in series, we get an increased wattage in combination with a higher voltage. Such 'higher voltage' means that series connection is more often applied in grid-tied sol. Here is a series connection of solar panels of different voltage ratings and the same current rating: You can see that if one of the solar panels has a lower voltage rating (and the same current. The next basic type of connecting solar panels is in parallel. Connecting solar panels in parallel is just the opposite of series connection and is used to increase the total output c. Here is a parallel connection of solar panels of different voltage ratings and the same current rating: As you can see, things are getting worse, since the total voltage of the array is determin. A combination of series and parallel connection is also possible. Indeed, this depends on the maximum possible total output voltage and maximum possible total output current of.
