

Solar thermal power generation glass pollution

Overview

Low-iron sand is required for PV glass production, to make the glass highly transparent and reduce the absorption of solar energy. As solar energy adoption accelerates globally, the environmental impact of photovoltaic (PV) glass manufacturing has become a critical concern. This article explores key pollution factors in PV glass production while highlighting innovative mitigation strategies adopted by industry leaders like EK. This would require about 89 million tonnes (Mt) of glass yearly, yet the actual production output of solar glass is only 24 Mt, highlighting a significant supply shortfall (3). As all power plants have a certain impact on the environment, so do PV power plants, and due to their planned large capacities, it is necessary. Solar energy technologies and power plants do not produce air pollution or greenhouse gases when operating. Although using solar energy technologies is generally.
